

Making Changes:

Cognitive Behavior Therapy for Binge Eating Disorder

Michele Laliberte, Ph.D., C.Psych.

Making Changes

Week 4

What About Body Image?

BED, Obesity and Body Image

- Weight Loss and Body Satisfaction
 - Weight loss *is* related to improved body satisfaction.
 - 5 - 15% results in improvement. No greater improvement with greater weight loss.
 - However, weight loss is *not* recommended as strategy for improving body satisfaction because of negative impact of even small weight regain.

Body Image – What *is* recommended?

- Cognitive Behavior Therapy for Body Image
 - Similar improvement in body satisfaction as found with weight loss.
 - Effects more lasting.
 - May even help with maintenance of weight loss.

Body Image – What can you do now?

- Acceptance of “natural” weight
 - Greater belief in weight control, the worse the body image and self esteem
 - Greater belief in striving for a healthy lifestyle with acceptance of natural weight, the better the body image and self esteem
 - This approach works, whatever “lifestyle” you choose: you control your lifestyle and accept the resulting weight. NO goal weight.

Body Image – What can you do now?

- Stabilize your eating
 - Helps you feel confident you are at your “natural” weight, and that you have nothing to apologize for.
- Stop binge eating
 - Binge eating makes it impossible to feel good about your lifestyle and to trust that your body is regulating your weight.
